3D Printing with TeraRecon

Printing your model is easier than ever. Every TeraRecon system houses a feature that allows the user to print directly from their existing workflow. It provides you a way to print full-color 3D models without the need for a printer, any 3rd party software, and it avoids the use of giant, inefficient STL files.

TeraRecon 3D Print Packs leverage a credits based model and allow for:

- Dramatically improved workflow compared to an in-house printing program, with zero start-up costs
- What you see is what you get, straight from the TeraRecon system with no need for editing
- Strikingly high-resolution, full-color models through and through - never painted!
- Immediate access to experienced experts in 3D model image segmentation and pre-production print design

TeraRecon 3D Print Pack credits are used for the purchase of non-diagnostic, 3D-printed physical models derived from medical images, which are intended for non-diagnostic display and discussion or education purposes only.
