

Carestream Provides Orthopaedic Digital Imaging Upgrade

Adama Gracy Hospital in Otwock, Poland, is now running the latest version 11 of CARESTREAM PACS, featuring 3D reconstruction and ORTHOVIEW™ Orthopaedic Digital Imaging that enables surgeons to spend time scrutinising results to ensure that the right decisions are made prior to surgery. "The system is operating well and is easy to use, the high functionality and collaboration with other systems and devices is its trump card and attention should be drawn to its ability to plan orthopaedic prostheses supported by the OrthoView System - very useful tools in the work of our orthopaedists," said Slawomir Chaberek.

Thanks to CARESTREAM PACS clinicians can conduct a study at one location and readily access the results on any computer at another location. The CARESTREAM PACS also supports Tomography, MRI and Ultrasound.

Adama Gracy Hospital is the only facility in Poland to house divisions specialising in Pelvic Damage and Pathology and Tuberculosis Bone - Cartilage. Its hospital departments treat 11,000 adults and children every year and specialist clinics for adults and children treat approximately 44,500 people annually.
