
Carevive Systems & Blue Spark Technologies to Conduct Real-Time Remote Patient Monitoring Pilot

Pilot aims to prevent symptoms in advance with contextualized data for cancer patient care

Carevive Systems, the leading oncology-focused health technology company centered on understanding and improving the cancer patient experience, announced today a partnership with [Blue Spark Technologies](#), a leader and an innovator in wearable wireless medical device solutions.

The study will integrate Carevive's expertise in Patient-Reported Outcomes (ePROs) data with Blue Spark's disruptive TempTraq continuous wearable remote temperature monitoring solution to investigate how early fever detection can guide clinical decision-making for adult oncology patients who are at increased risk for infection. The study will be conducted across three sites with the potential to add more site locations, as needed.

"We're proud to be putting patients' real-world experiences at the heart of the care process," said [April Boyd](#), Sr. Clinical Content Developer, Carevive Systems, Inc. "Electronic patient-reported outcomes data are crucial for proactive symptom management – helping patients live more comfortably, and for longer, while studying them together provides us with an important resource for improving patient-centered care. We're really excited by the potential outcomes of this study to help countless more cancer patients."

According to the Centers for Disease Control and Prevention (CDC), people with cancer who are treated with chemotherapy are more likely to develop infections. Cancer and chemotherapy can reduce the effectiveness of the immune system by reducing the number of infection-fighting white blood cells. Often the first sign of infection is an increase in body temperature (fever).

Patients in the study will report their symptoms through Carevive's [PROmpt®](#) while wearing Blue Spark's TempTraq®, a soft wearable patch that continuously, safely and comfortably monitors body temperature, allowing clinicians to also monitor real-time patient health data. The opportunity to learn from clinicians about these data value and patients about their reporting experience are key pilot goals.

"TempTraq has been clinically proven to detect fevers hours before the standard of care in high-risk chemotherapy treatments, bone marrow transplants and CAR-T's, and those hours are critical in this patient population," said [Ruth Phillips](#), Director of Medical Affairs at Blue Spark Technologies. "Our team has created a soft, comfortable patch, and we're delighted to be able to use it to support this revolutionary approach to improving cancer care."

"The use of a symptom monitoring and high frequency temperature dataset can allow for targeted triage and efficient clinical decision making with the goal of early intervention," said Sung Choi, M.D., Associate Professor of Pediatric Hematology/Oncology at the University of Michigan and Lead Investigator on the pilot study. "The TempTraq and Carevive project has the potential to lay a strong foundation for the design of a larger study looking at remote patient monitoring in the oncology setting."
