Covidien's New Alarm Management System (AMS) for the Nellcor "OxiMax"

N-600x™ pulse oximeter identifies and alerts staff to ongoing developments, such as periods of desaturation and potentially worrisome patterns. AMS includes the OxiMax SPD™ alert, which detects desaturation patterns indicative of repetitive reductions in airflow, even if the patient hasn't crossed the SpO₂ threshold. AMS also includes SatSeconds™ alarm management, which provides a safe and practical way to reduce less clinically significant alarms. With AMS, you can be sure to get a more complete picture of your patient's oxygenation.
