

Elekta Gamma Knife Scores Top KLAS Award

With a score of 94.4 out of 100, Elekta's Leksell Gamma Knife® Perfexion™ ranked at the top among six advanced radiation therapy systems, according to KLAS research firm's recently released customer survey, Radiation Therapy 2011: A Dose of New Technology. The Elekta Infinity™ radiation treatment system garnered the #2 ranking with a score of 84.4, improving its score over the 2010 report.

The 2011 KLAS report – the result of interviews with 213 U.S. provider organizations – referenced respondents' regard for the Perfexion system's technological sophistication, making "treating very complicated tumors in a difficult spot easy for providers," and for the radiosurgery platform's unprecedented uptime statistics. The report summarized customer opinion by noting: "The speed, accuracy, reliability, and sophistication of the treatments all came together for the Gamma Knife Perfexion to earn the highest score in the study by a 10-point margin."

Gamma Knife® surgery is a gentler alternative to traditional brain surgery for illnesses such as metastatic disease – cancer that has traveled to the brain from elsewhere in the body. The system delivers thousands of low-intensity radiation beams to one or more targets in a single session.
