First Use of New Subcutaneous Heart Monitor

Physicians may choose the Reveal XT insertable cardiac monitor for their patients with suspected arrhythmias, and in difficult-to-diagnose patients for whom long-term cardiac rhythm trending data may aid in a more informed diagnosis. The Reveal XT device is also an option for physicians seeking to detect the presence of atrial arrhythmias (irregular heart rhythms in the upper chambers), including asymptomatic episodes, or to monitor the amount of time a patient is in atrial fibrillation (AF) to assess whether medical treatment is necessary or should be adjusted.
