Getinge Launches Pass-Through AER at MEDICA

The double-door pass-through unit is designed to be built into a wall, thus assuring a physical barrier soiled and clean areas, thereby reducing the risk of cross-contamination in larger hospitals and endoscopy clinics. Having two asynchronous chambers and a 22-25-minute process means fast turnaround times and high throughput and up to 6 endoscopes can be run in just above an hour.

The Getinge ED-FLOW AER also offers hands-free operation and RFID technology, which means that it can be loaded, started and unloaded without the operator having to touch any panels or buttons with soiled hands.
