#### Epinephrine for out-of-hospital cardiac arrest

“Epinephrine (or adrenaline for EU physicians) has alpha-adrenergic action which leads to increased coronary blood flow but also beta-adrenergic action that can lead to the recurrence of VF/VT and can also impair cerebral microvascular blood flow. Additionally, recent data from randomised controlled trials on cardiogenic shock) or meta-analysis highlight poor outcome associated with epinephrine use. In this context, clinical trial of drug use with only “alpha-adrenergic” action such as norepinephrine deserves attention.”

#### How ICU diaries can help patients and families

“The importance of the diaries is demonstrated when patients have vivid memories and the diaries are able to provide explanations. For example, a patient remembers his throat being cut with a knife; the diary tells the patient he had a central venous catheter put in and we can then explain the procedure to him. Patients have such wide-ranging comments. It is often a relief for them to tell us stories their relatives don't believe and sometimes we can help them find some kind of reality in the story or just reassure them that it can be like that after ICU.”
