

Intelrad Launches New Performance and Quality Suite

Intelrad Medical Systems™, the medical imaging PACS, RIS and workflow solutions company, has announced the launch of their Performance and Quality Suite, which provides imaging enterprises with a set of key Intelrad modules designed to improve operational performance and diagnostic standards.

“We’re often told by customers that remaining competitive within the industry requires them to continually refine their offerings,” said Randall Oka, President and CEO, Intelrad. “Our Performance and Quality Suite responds to this by allowing imaging enterprises to easily evaluate and provide feedback on colleagues’ work, while enhancing communication and tracking overall performance.”

To improve diagnostic quality levels, the Performance and Quality Suite features a newly-enhanced Peer Review module that comes fully integrated into InteleViewer™ to simplify the process and help deliver timely feedback. The Image Quality Review module allows radiologists to provide feedback to technologists regarding the quality of images produced, while the new integrated Resident Over-Reads module improves the reporting quality of radiologists in training.

The Suite also features Intelrad’s Critical Results module, which improves patient care by enabling better prioritisation and tracking of critical cases, and enhancing communications with referring and emergency room physicians.

In order to measure performance and facilitate continual improvement, the Suite leverages Intelrad Analytics™ to provide real-time metrics regarding radiologist productivity, quality levels, departmental workflow, study volumes, turnaround times and more.
