
Israeli Hospital Prepares Telemedicine for COVID-19

[WHO renamed COVID-19 on February 11](#) in a bid to avoid inaccuracies or de-stigmatisation stemming from the name of the coronavirus.

Meanwhile, the respiratory virus has opened doors to technological applications that range from telemedicine to AI integration.

The Sheba Medical Centre, the largest hospital in Israel, launched a telemedicine programme in a bid to control virus spread.

The two-fold programme is being tested on suspected COVID-19 patient cases.

A Vici telemedicine solution designed by American virtual healthcare company Intouch Health, is being deployed. Medical staff control this robot outside a patient's room, reducing the risk of infection spread. The robot checks patient's vital signs.

The centre also [plans to utilise telemedicine for monitoring](#) of less-ill patients from the comfort of their own homes, again, reducing the possibility of virus spread. The set up will also serve as an alternative to short-supply isolation rooms.
