

North Carolina Hospitals Opt for Intelrad Radiology Platform

Intelrad Medical Systems™ has announced that Cape Fear Valley Health has selected IntelePACS® as the central radiology platform for their five-hospital network.

“When we set out to find a new PACS, our goal was to find a state-of-the-art solution that could handle the needs of a growing health system,” said Dan Cameron, Cape Fear Valley’s Director of Radiology Services. “IntelePACS not only meets these needs, but also provides our radiologists and referring physicians with a solution that is easy to use, which is also highly beneficial.”

Located in Fayetteville, North Carolina, Cape Fear Valley maintains over 700 beds, and reads nearly 300,000 studies per year. On top of maintaining one of the country’s top volume emergency departments, which treats 130,000 visits per year, the robust regional medical centre also specialises in heart care, orthopaedics, cancer treatment and surgical services.

As part of their IntelePACS deployment, Cape Fear Valley’s radiologists will be provided InteleViewer™ as their primary diagnostic viewer. In addition, the health system will also integrate InteleConnect™ to facilitate results delivery to referring physicians, Intelrad’s Master Patient Index, and dedicated modules for breast imaging, peer review and teaching files.

“Having deployed our solutions to large, metropolitan-based hospitals and level one trauma centres for over 15 years, we are confident that IntelePACS will make a positive impact at Cape Fear Valley,” said Randall Oka, President and CEO, Intelrad. “By streamlining their radiology workflows and facilitating results delivery, our solutions will help them to increase productivity, as well as their levels of patient care.”
