
Philips Advances its eICU Telehealth Offering

Philips has announced the launch of its IntelliSpace eCareManager 3.9 healthcare platform, powered by orb, during the Healthcare Information and Management Systems Society (HIMSS) 2013 conference and exhibition. Included in Philips' latest offering to its eICU programme is orb, a new graphical dashboard that is actuated by over 100 clinical rules, to analyse, process and visualise complex clinical data in real time and tell a better story about what is going on with that specific patient, and in a visually digestible form.

Currently, Philips eICU customers have oversight for nearly 7,000 ICU beds, with approximately 150 patients being monitored in an average Tele-ICU simultaneously, with larger sites caring for over 400 patients on any given day. To present data to support proactive patient interaction, a new type of population-based representation is needed.

Orb's ability to integrate practical data with visual technology helps clinicians to prioritise patient needs and streamline in-hospital care. The dashboard features circles that represent individual patients and their health status. By viewing these circles, clinicians can determine, at a glance, important patient or population-level information, such as which patients are in need of immediate care versus others who might be ready for hospital discharge. It also helps clinicians prioritise information that was previously unavailable due to the massive amount of data created by a single patient, whether they are providing care at the bedside, from the nurses' station, or hundreds of miles away from a remote, centralised telehealth care team.

"Health reform places priority on improving the quality of patient care, and key performance indicators such as patient mortality, length of stay, hospital-acquired infections, and hospital readmissions across health system enterprises," said Lori Lazzara, vice president and general manager, Connected Care Solutions, Philips Healthcare. "Philips eICU Programme customers monitor more than 350,000 ICU patients every year and orb demonstrates our commitment to connected care, giving clinicians the flexibility to manage a large population of patients without losing the individualised treatment needs of each person."

Hospital systems participating in peer-reviewed studies on Tele-ICU programmes have shown a reduction in mortality of 20% and length of stay by 30%, 1,2,3 and cost reductions in one of the highest cost areas for any hospital. Showcasing its commitment in this space, the Philips eICU programme solution blends medicine, transformative services and technology to address ICU physician and nurse shortages, increase access to care and improve quality of care.

Key functions and customer benefits of the IntelliSpace eCareManager healthcare platform, powered by orb:

- Enables proportional population management to leverage scarce resources;
- Provides proactive management of patients to avoid complications;
- Visualizes key physiologic indicators for overall patient health/progression;
- Optimizes existing care-provider staff; and
- Incorporates single-point visualisation of data otherwise fragmented across many systems.
