

Sustainability at Hamilton Medical

The first sustainability report for the year 2022 is out, covering our concept, actions, and goals for combining value creation with social justice and ecological responsibility.

Economic success is important for every company, but so is the future. The Hamilton group started measuring its total carbon footprint in 2021 and has set targets for reducing its greenhouse gas emissions. These have been submitted to the Science Based Targets initiative, a worldwide movement of more than 4,000 companies taking action against climate change.

In the group's first sustainability report, which covers Hamilton Medical and several other companies all with shared infrastructure, you can find out more about our concept, actions, and goals for combining value creation with social justice and ecological responsibility. The progress we make in reaching these goals will be tracked in an annual report in the years to come.
