The current hospital system in Greece is a direct result of Act 1397/1983 that established the National Health System (NHS). Laws that were later enforced brought about some changes, but did not modify the basic characteristics of the system.

The Greek National Health System is responsible for 327 hospitals, both in the public and private sector, totalling 51,762 beds (according to statistics from 2005). The average bed occupancy is 80% and the average length of stay is six days for the public sector and eight days for the private sector (excluding rehabilitation, chronic and psychiatric cases).

Public Sector

Act 397/1983 stipulated that all hospitals that received government subsidies had to become public. This also applied to certain hospitals e.g. academic, military or those funded by social insurance funds. Staff in these hospitals became civil servants. Only two hospitals did not change their status, since they received funding from private donors; they have, however, maintained certain characteristics of a publicly operated enterprise.

An important regulatory innovation was established by Law 3293/2004, allowing - for the first time within the healthcare system, a state-owned company in the healthcare sector.

Today there are 148 public hospitals in Greece: 115 general and 33 specialised, offering 35,814 beds in total. The largest hospital has 1,100 beds, while smaller hospitals have 242 beds on average. Thirty percent of public hospitals - which allocate 40% of all beds - can be found in and around Athens.

In 2005, GNHS hospitals employed 98,226 people. Doctors represent 23.5% and all nurses 42.5% of the total. Only 19% of hospital staff members are graduate nurses (i.e. registered nurses). NHS doctors have their own salary scale, which is higher than that of other specialised hospital staff. In addition, doctors receive compensation for after-hour service (night duty).

Up to 2000 all public hospitals were solely dependent on the Ministry of Health and Social Solidarity for their annual budgetary funding. With the introduction of Act 2889/2001, an effort was made to decentralise health services and Regional Health Systems were created. However, these bodies do not have any power. Important decisions are still taken centrally by the Ministry. Currently there are 17 Regional Health Systems, but the Greek government recently announced that they will be cut back to seven and later abolished all together. The same Act also introduced the position of hospital manager for the first time; larger hospitals also have a deputy hospital manager.

Private Sector

The 179 private hospitals, called clinics, have a total of 14,528 beds, which translates into 75 beds per hospital. About 15 of these clinics are large, offering a few hundred beds. These clinics are usually owned by a group of companies. Their patients either have private health insurance or pay from their own pockets. As these private clinics determine the cost of treatment and doctors' salaries themselves, their cost structures are much higher than those of public hospitals that inevitably lead to conflict with insurance companies.

Some small private clinics work within the parameters of social insurance funds. So, they charge daily hospital fee, as defined by the government. Most of the larger clinics are general hospitals, while 53% of smaller clinics are specialised. According to law, the stocks are nominatives if a private clinic belongs to a company.

Hospital Managers

A board of directors - seven members for hospitals with up to 399 beds or nine for hospitals with more beds - manages public hospitals. The government appoints the majority of the members along with the Chairman of the Board who is the hospital manager. Until 2004 hospital managers were appointed for five years and could not be released, unless there was a serious official reason. From 2004, hospital managers have been appointed by the Minister for two years, without a contract and they can be released before the end of their term, without compensation.

In the private hospital sector, general managers are selected according to meritocracy criteria. They already have already extensive experience as a CEO and would thus receive remuneration reflecting their status.

Internal Organisation

The organisational structure of Greek hospitals is more or less similar in both the public and private sector.

Although GNHS hospitals have a Medical Directorate, each department or unit (e.g. pathology, surgery, nephrology) functions autonomously and has its own director, as in the private sector.

There is also a Nursing Directorate that is divided into sectors and departments. In public hospitals, there is a nursing department for every medical department or unit (e.g. operating room, intensive care, etc.). In private hospitals, it is more likely that one nursing department would take care of various medical departments.

The Administrative Directorate with sub directorates for the administrative and financial issues, deal with all administrative matters. The Administrative Director is in charge of staff, hospital budgets, moving patients, dietary needs of patients, secretarial support of all services, developing IT, etc.

All hospitals have a Technical Directorate, which is responsible for the maintenance of buildings and mechanical installations and biomedical equipment. In public hospitals, the biomedical engineering department falls under this directorate.
