
Toshiba and Maquet Partnership to Offer Hybrid Solutions for Infinix-i

The partnership combines the Infinix-i systems' image quality and versatility with a complete range of innovative MAQUET tabletop options, which range from general surgery to radiology-specific. The Toshiba/MAQUET hybrid operating room (OR) suite is claimed to be the only hybrid solution to offer interchangeable table tops, optimising asset utilisation of these specialised OR suites. Because ceiling mounted systems are typically best suited for a hybrid operating room setting, these table tops match perfectly with Toshiba's Infinix CC-i and Infinix VC-i systems.

"The Toshiba and MAQUET partnership provides physicians with a single system for imaging and surgical procedures, without compromising image quality or safety," explained Robert Micer, director, X-ray Vascular Business Unit, Toshiba. "Not only does this partnership help improve patient care and access, it offers better asset utilization for hospitals. By having a system in an operating room that can perform multiple procedures, hospitals can ensure that hybrid suite settings are utilized for more than just surgery. They can also be used for diagnostic and interventional imaging procedures, as well as hybrid procedures that involve surgeons and interventionalists working together."
