

TwinStream ICU - The lung protective ventilation in intensive care for acutely ill patients

TwinStream™ ICU offers oxygenation ventilation with unsurpassed efficiency and safety. It is the only system in the market to offer pulsatile BiLevel Ventilation **p-BLV™** (See Infobox).

The **p-BLV™** module generates a pulsatile gas column. This facilitates optimal gas exchange, respiratory gas conditioning and transmission of the pressure wave amplitude into the lung. This represents a significant advantage over conventional ventilation systems.

TwinStream™ ICU With **p-BLV™** provides the best ventilation method for patients with:

- Acute respiratory distress syndrome (ARDS)
- *Pneumonia (ALI-VILI)*
- *Severe chest trauma in the context of polytrauma*

□

After 4 hours of ventilation with **TwinStream™** ICU, a significant improvement of the pulmonary condition is seen.
