UK Hospital Installs New Ergonomic Workstations

Manufactured by PLANILUX in Germany, the manufacturer of Multiviewers, these new, highly ergonomic workstations were designed in response to concerns by the Health and Safety Executive for radiologists who show signs of repetitive stress injury (RSI) after spending many hours reporting at monitors.

With adaptive lighting, the ability to tilt and adjust the height of both the work surface and monitors plus the sound absorbing ability of the background screen the ELTRONO workstations overcome the RSI related injuries to the shoulders, neck, wrist, arm and elbows due to long periods of computer work. These features also reduce eyestrain and fatigue and ensure a safe, comfortable and ergonomic environment for reporting the large number of images handled in today
