Update to Matrox Imaging Library Announced

Matrox Imaging is announcing a new module for its Matrox Imaging Library (MIL). "Adding a metrology tool was the next logical step for MIL", explains Pierantonio Boriero, Product Line Manager, Matrox Imaging.

As part of Processing Pack 3, the latest update to the current MIL 8.0 release, the Metrology module tool measures and constructs geometric features. Users may measure finite features such as arcs, circles, line segments, and points in specific image regions, and can also construct features within the image. In addition, users may define and validate tolerances from dimensions, positions and shape (angularity, concentricity, perpendicularity, roundness and straightness). The Metrology module supports calibration to obtain results in real-world coordinate systems.
